

E14 — monogamy vs promiscuity: the best mate-pool breadth shrinks as skills get more entangled

(A) the champion: best model in the population
best fitness peaks at INTERMEDIATE breadth
on rugged landscapes (the peak shifts left as K rises)

(B) the typical model: population mean
monotonically favoured by wide breadth
(panmixia lifts the whole population)

(C) standing diversity
monotonically destroyed by breadth
(promiscuity homogenises; monogamy preserves)
